APPLICATION BULLETIN

APPLICATION: De-Barker In-feed Conveyor

INDUSTRY: Dimension Lumber, OSB and Plywood / Veneer Plants

PRODUCT: Oil Shear Posidyne Clutch/Brake

DE-BARKER IN-FEED CONVEYOR
**DE-BARKER IN-FEED CONVEYOR**

WHERE THEY ARE USED: De-Barkers are used in most lumber operations including Dimension Lumber, Plywood/Veneer, and OSB plants. The In-feed Conveyor is used to feed the De-Barker, spacing the logs so they go through one at a time.

HOW THEY WORK: The De-Barker In-feed Conveyor is a chain conveyor, controlled by the operator. If more than one log is in the system the Infeed Conveyor will stop until the first is fully into the De-Barker.

PROBLEMS SOLVED: There is often only one De-Barker at a mill making the In-feed Conveyor critical to the throughput of the mill. The **Posidyne** Clutch/Brake reduces the starting load on the motor improving efficiency, and reducing motor failures by allowing the motor to run continuously. The **Oil Shear** system lubricates and cools the friction discs so that the **Posidyne** Clutch/Brake can provide many years of service under the grueling conditions of log handling. The quick response of the **Posidyne** Clutch/Brake enables the operator to have immediate control of the logs reducing jams etc.

IMPORTANT FEATURES:

- Totally enclosed, oil cooled unit for long service life with low maintenance in the harshest environments.

- Oil Shear Technology and innovative friction material provide smooth controlled torque for quick, smooth acceleration.

- Consistently accurate starts and stops with no adjustment required.

- Continuously running standard motor for long service and lower energy consumption
