Section 1
DESCRIPTION and OPERATION

1-1 MANUAL DESCRIPTION
This manual covers the BESCOSTOP Oil Shear Motor Brakes, Models MB-280-223 (Old Style) and MB-280-238 (New Style). These (2) brakes are identical except for the Cooling Fan as shown in Figure 10.2. The Installation, Disassembly and Reassembly Procedures described in this manual reflects the new style fan. The old fan that was used in the MB-280-223 Motor Brake is no longer available. It has been changed to a new style fan that requires a Clamping Collar to hold it in place on the Hub.

NOTES - If you order a Replacement Fan, you will receive the new style along with the Clamping Collar and attaching screws.

The Besser Part Number 113759 is the same for both models.

1-2 THE OIL SHEAR PRINCIPLE
Conventional clutches and brakes depend on the friction between solid surfaces operating in air to transmit torque. Friction does the job, but produces a great amount of HEAT and WEAR, causing an increase in replacement parts, breakdown and maintenance time.

OIL SHEAR TECHNOLOGY was pioneered by Force Control in 1959 and resulted in one of the most energy efficient Brake/Clutch/Variable Speed Drive Systems available today.

In 1970 Force Control introduced an Integral Oil Pump, which requires no additional parts. This oil pump forces a positive oil feed from the center of the brake disc stack to “Float” the friction surfaces in a continuously circulating bath of oil.

The oil molecules tend to cling to each other and also to the friction surfaces. As moving and stationary surfaces are brought together, a thin but positive film of oil is maintained between them and is controlled by the clamping pressure and grooves designed into the braking surfaces.

TORQUE is transmitted from one surface to the other through the viscous shear of the oil film. The braking surfaces are protected by this oil film, which reduces wear and effectively transmits heat away from the braking surfaces.

...thus brake wear is greatly reduced along with all routine maintenance common to conventional dry motor brakes.

AN OIL CHANGE EVERY (3) THREE MONTHS IS ALL THAT IS REQUIRED FOR NORMAL MAINTENANCE.

1-3 DESCRIPTION
BESCOSTOP Motor Brakes are multiple surface, spring activated, pneumatic release braking devices that effectively dissipate the heat generated from electric motors requiring frequent starting and stopping.

This Manual covers the MB-280-223 and MB-280-238. For information on other sizes and models not covered in this manual, contact Besser Company.

1-4 FEATURES (See Figure 1.1)
1. NEMA-C STANDARD FLANGE MOUNTING to any suitable double shaft drive motor.
2. “COLLET” LOCKING ELEMENT for a positive self locking, keyless hub mounting with high torque transmitting capabilities.
3. “COLLET” ADVANTAGES:
   a. CONVENIENT EASY MOUNTING - No press fits or costly machining necessary. Allows use of commercial tolerance motor shafts.
   b. EASY RELEASING AT DISASSEMBLY.
   c. TOTALLY SELF CENTERING.
   d. FULL SHAFT STRENGTH - Since no metal is removed, stress concentrations are avoided permitting shafts to retain their full strength.
4. INTERNAL CENTRIFUGAL TYPE OIL PUMP - Maintains positive oil film between braking surfaces without external pumping devices.
5. FAN COOLING - For maximum and efficient heat dissipation.
6. MULTIPLE BRAKING DISC STACK - At the heart of your BESCOSTOP Motor Brake is a multiple braking disc stack consisting of drive plates, keyed to the piston housing and friction discs, splined to the drive hub.

AS A RESULT, THE TORQUE is distributed along the hub rather than on a single braking surface reducing the heat and wear on each brake disc.
1-5 OPERATION
The BESCOSTOP Motor Brake Cross Section (Figure 1.1) shows the brake in the normally spring loaded braking position. Figure 1.1 also shows the Model MB-280-238 with the new style fan.

Compressed air, controlled by external valving, enters the piston housing and moves the piston to disengage the multiple braking disc stack, allowing the drive motor to rotate freely.

When the air pressure is released the piston (spring loaded) returns to the normal braking position.

TORQUE CAPACITY
The Assembly Configuration for the Drive Plates #12 and #18 and the Friction Discs #13 are shown in Figure 2.2.

See 9-6 INSTALLING SEPARATOR SPRINGS and 9-7 INSTALLING BRAKE STACK located in Section 9 on Pages 13 and 14 for Assembly Procedure.

Figure 2.2 - Brake Stack Assembly Configuration
Section 3
INSTALLATION

IMPORTANT SAFETY PRECAUTIONS
The brake units described in this manual must not be installed in any manner except as specified herein, and must not be operated at speeds, torque loads or temperatures other than those specified in this manual. Failure to limit operation of the brakes to the conditions specified could damage the units and may cause malfunction or damage to interconnecting equipment.

WARNING
The following precautions must be taken if the installation of the BESCOSTOP Motor Brake is to be a retrofit for an existing application. Before attempting installation, open the motor disconnect, shut off the control electrical supply and shut off the air supply then lock them out to avoid the possibility of personal injury.

NOTE
The BESCOSTOP Motor Brake has been partially assembled at the factory for ease of shipment. Partial disassembly will be necessary to assemble the brake to the motor.

This Installation Procedure only covers the initial retrofit installation of the motor brake to the drive motor. See Section 7 for complete Disassembly and Section 9 for Reassembly Procedure.

See Figures 10.1 and 10.2 for a visual reference to the parts.

A Special Installation Tool is used to install the brake unit to the drive motor. This tool can be ordered from the Besser Company with the Part Number 114807.

Dimensions and material specifications are given in Figure 3.1 if you prefer to make your own.

3-1 INSTALLATION PROCEDURE
(See Figure 10.2)
1. First check the motor shaft for any nicks or burrs. Clean up and deburr as necessary.

CAUTION
Do not use any molybdenum disulfide “MOLYKOTE” or any other similar lubricant on the motor shaft. The collet hub locking element is keyless and depends on friction to transmit torque from the brake to the shaft.

2. The Collet (#110) is shipped inside the Hub (#2). Manually pull it out of the bore.

NOTE: There is a cardboard retainer holding the collet in the hub. This can be removed by hand.

3. Remove the Fan Shroud (#24) by taking out the (4) Screws (#166) and (4) Lockwashers (#167).

NOTE: The Fan (#25) does not have to be removed.

4. Align the Hub (#2) approx. 3/16” from the machined surface of the motor mounting flange as shown in Figure 3.2.
5. Thread the Special Installation Tool #114807 into the Collet (#110) and place the collet all the way on the motor shaft. (See Figure 3.3)

**IMPORTANT**
Only thread the tool to thread hole depth into the collet as shown in Figure 3.3.

![Figure 3.3 - Installing Collet on Motor Shaft](image)

6. Remove the (2) Hex Nuts and Handle from the Installation Tool (#114807).

7. Attach an overhead hoist and sling to the Brake Assembly and slide it onto the motor shaft. (See Figure 3.4)

![Figure 3.4 - Installing Brake onto Drive Motor](image)

8. Attach the Brake Assembly to the Drive Motor with (4) Screws (#150) and (4) Lockwashers (#128). **Torque to 60 Ft. Lbs.**

**NOTE:** Insert the screws head first into the machined pockets to allow for proper clearance to the mounting holes as shown in Figure 3.5. Do not use shorter screws.

9. Reattach the handle to the Installation Tool and manually pull back to seat the Collet (#110) into the Hub (#2) bore as shown in Figure 3.6.

**IMPORTANT**
It does not require excessive force to seat this collet properly.

![Figure 3.5 - Installing Motor Mounting Screws](image)

![Figure 3.6 - Seating Collet into Hub](image)

10. Remove the Installation Tool from the Brake.

11. Install the Hub Locking Screw (#94) and Lockwasher (#168). **Torque to 120 Ft. Lbs.**

**IMPORTANT**
It is very important that this Hub Locking Screw (#94) be torqued to 120 Ft. Lbs. otherwise the Brake may not function properly.

12. Reinstall the Fan Shroud (#24) with (4) Screws (#166) and (4) Lockwashers (#167).

13. Remove the red plastic pipe plug from the top of the brake and fill the unit with fresh oil as directed in Section 4 - LUBRICATION.
14. Make an Operational Check of the Brake Unit as specified in Section 5.

15. Install Reducer Bushing (#76) and Air Breather (#45) into the top of the brake. (See Figure 3.7 below.)

**IMPORTANT**
It is very important that this Breather (#45) be installed before the BESCOSTOP Brake is put into service.

16. Connect electrical and pneumatic lines to the control valve. (See Figure 3.8 for Control Valve Schematic.)

---

**Section 4**  
**LUBRICATION**

4-1 **CHECKING THE OIL LEVEL**

Check the oil level when the drive is installed and weekly thereafter (until experience dictates otherwise). Always check the oil level with the unit stationary (not running).

**NOTES:**
There is a L.H. Drive and a R.H. Drive. Both units are setting at approx. 11° and have (2) Sight Gauges (#46) installed in the brake housing. The oil level is to be at the center of the highest sight gauge as shown in Figure 4.1.

4-2 **CHANGING THE OIL**

Every three (3) months remove Drain Plug (#74) at the bottom of the End Housing (#9) and the Pipe Cap (#67) at the bottom of Housing (#8). Drain all oil before refilling. More frequent oil change may be required on high kinetic energy applications or in extremely dirty environments.

Check both Oil Sight Gauges (#46) for dirt. Remove and clean them if necessary. Replace the drain plugs and sight gauges. Remove the Pipe Plug (#78) from the Elbow (#125) and refill unit with clean oil up to the center of the appropriate sight gauge as shown in Figure 4.1. Approximate capacity is just over 2 Quarts.

**CAUTION**
Do not over fill with oil. Excess oil will cause the unit to overheat.

4-3 **TYPE OF OIL**

Only use Mobil Automatic Transmission Fluid ATF-210 (Type F) or Mobil Multi-Purpose Automatic Transmission Fluid.

**CAUTION**
Use of the wrong brand or type of Automatic Transmission Fluid will cause erratic operation, premature wear, damage to the unit and void the warranty.
Section 5
OPERATIONAL CHECKS

**WARNING**
Make Operational Checks only when the drive motor and motor brake are not in operation. Open motor disconnect and lock it out to avoid personal injury.

5-1 OPERATIONAL CHECKS
1. Make provisions for manual operation, if automatic controls are used.
2. Remove Air Breather (#45) and Reducer Bushing (#76) from End Housing (#9). **Do not remove while motor is operating.**
3. Apply 60 to 80 P.S.I. air pressure to the brake and observe the action of the piston through the air breather port. If the piston action is irregular, or if it tends to stick or bind, internal damage may be indicated. Listen and look for air bubbles in the oil which would indicate piston leakage.
4. If the piston moves slowly and leaks are evident, the piston seals may be damaged.
5. Exhaust the air pressure and observe that the piston returns quickly and smoothly back to the normal braking position.
6. Reinstall the Reducer Bushing (#76) and the Breather (#45) back into the End Housing (#9).
# Section 6
## TROUBLESHOOTING

<table>
<thead>
<tr>
<th>TROUBLE</th>
<th>POSSIBLE CAUSE</th>
<th>REMEDY</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Brake fails to engage properly.</td>
<td>Piston sticking or binding.</td>
<td>Disassemble to the extent necessary and inspect for damaged parts.</td>
</tr>
<tr>
<td></td>
<td>Worn Friction Discs.</td>
<td>Replace Brake Stack.</td>
</tr>
<tr>
<td></td>
<td>Weak or broken spring.</td>
<td>Replace as needed.</td>
</tr>
<tr>
<td></td>
<td>Air pressure not exhausting or slow in exhausting.</td>
<td>Check air regulator valve and replace if necessary.</td>
</tr>
<tr>
<td>B. Brake engages too quickly.</td>
<td>Low oil level.</td>
<td>Check oil level and correct.</td>
</tr>
<tr>
<td>C. Noise and vibration.</td>
<td>Improper or loose mounting on motor.</td>
<td>Check mounting and correct. If partial disassembly is required, refer to Installation Section 3.</td>
</tr>
<tr>
<td>D. Brake fails to disengage properly.</td>
<td>Low air pressure.</td>
<td>Increase pressure (See Table 2.1).</td>
</tr>
<tr>
<td></td>
<td>Piston sticking or binding.</td>
<td>Disassemble to the extent necessary and inspect for damaged parts.</td>
</tr>
<tr>
<td></td>
<td>Air regulator valve not functioning properly.</td>
<td>Check valve operation and replace if necessary.</td>
</tr>
<tr>
<td>E. Unit overheats. (Temperature over 225 °F).</td>
<td>Brake not engaging or disengaging properly causing excessive slip-page.</td>
<td>Refer to troubles A and D.</td>
</tr>
<tr>
<td></td>
<td>Improper oil level.</td>
<td>Check level and add or drain as necessary.</td>
</tr>
<tr>
<td></td>
<td>Fan loose on shaft.</td>
<td>Tighten fan holding screw.</td>

<tr>
<td>F. Oil leakage.</td>
<td>Oil Seal lip damaged or Wear Sleeve damaged.</td>
<td>Check for oil leaking around the shaft. Replace if necessary.</td>
</tr>
<tr>
<td></td>
<td>O-ring seals.</td>
<td>Tighten all external bolts.</td>
</tr>
<tr>
<td>G. Oil leakage at breather.</td>
<td>Damaged seal around piston.</td>
<td>Disassemble and replace.</td>
</tr>
<tr>
<td></td>
<td>Oil level too high.</td>
<td>Drain excess oil.</td>
</tr>
<tr>
<td>H. Brake does not repeat.</td>
<td>Air pressure changed.</td>
<td>Check and adjust air pressure.</td>
</tr>
<tr>
<td></td>
<td>* Oil temperature changed.</td>
<td>Check temperature.</td>
</tr>
</tbody>
</table>

*NOTE - For installations requiring precise starting and stopping, operating temperatures are important. Operating temperatures between 116° F and 165 ° F. are recommended.*
Section 7
DISASSEMBLY

WARNING
Before attempting disassembly of the BESCOSTOP Motor Brake, open the motor disconnect, shut off the control electrical supply and shut off the air supply. Lock them out to avoid the possibility of any personal injury.

Unless the brake is to be completely overhauled, it should be disassembled only to the extent necessary to gain access to the worn or damaged parts.

See Figures 10.1 and 10.2 for a visual reference to all the parts.

7-1 DISCONNECTING THE MOTOR BRAKE FROM THE DRIVE MOTOR

1. Remove Drain Plug (#74) and Pipe Cap (#67) and drain all the fluid into a suitable container. Save or discard as the condition warrants. Also remove the Air Breather (#45) so it doesn't get damaged.

2. Disconnect the pneumatic air lines and electrical connections to the Control Valve (#270).

3. Remove the Fan Shroud (#24) by taking out (4) Screws (#166) and (4) Lockwashers (#167).

4. Remove the Hub Locking Screw (#94) and Lockwasher (#168) from the end of the Hub (#2) with an impact wrench.

5. Install an eyebolt and soft sling to the top of the brake.

6. Remove the (4) Mounting Bolts (#150) and (4) Lockwashers (#128) from the Housing (#8).

NOTE - A Special Disassembly Tool and a Jack Bolt has to be used to disengage the Collet (#110) from the Hub (#2). These can be ordered from the Besser Company by using the Part Number 114806.

Dimensions and material specifications are given in Figure 7.1 if you prefer to make your own.

7. Insert the Disassembly Tool (#114806) into the end of the Hub (#2) and thread it into the Collet (#110) using a flat head screw driver. Leave about 3/4" to 1" exposed thread in the Hub (#2) as shown in Figure 7.2.

8. Insert a large flat head screw driver between the motor face and Housing (#8). Pry the Brake Assembly away from the drive motor. Pull the Brake assembly straight back until it clears the Disassembly Tool.

9. Remove the Collet (#110) from the motor shaft and unscrew the tool from the collet threads.

7-2 "IN PLACE" REMOVAL OF THE FAN (#25)
(See Figures 10.1 and 10.2)

1. Remove the Fan Shroud (#24) by taking out the (4) Screws (#166) and (4) Lockwashers (#167).

2. Remove the (2) Screws (#149) and pull the Fan (#25) off the Hub (#2).

It is not necessary to remove the Clamping Collar (#331) if you are just replacing the Fan (#25), but if you also plan on removing the End Housing (#9) then you must remove the Clamping Collar (#331) from the Hub (#2).

3. Loosen the 1/4"-20 Screw in the Clamping Collar (#331) and pull the Collar off the Hub (#2).

7-3 "IN PLACE" REMOVAL OF END HOUSING FOR ACCESS TO THE BRAKE STACK
(See Figures 10.1 and 10.2)

1. Remove Drain Plug (#74) and Pipe Cap (#67) and drain all the fluid into a suitable container. Save or discard as the condition warrants.
2. Remove the Fan Shroud (#24), Fan (#25) and Clamping Collar (#331) from the brake unit with the same procedure as described in the previous Section 7-2.

3. Remove (6) Screws (#72) and (6) Lockwashers (#127) from the End Housing (#9). Also remove the (2) Screws (#273) and (2) Lockwashers (#275) holding the Control Valve Mounting Bracket (#271) to the End Housing. Take the Bracket and Valve off the End Housing.

4. Pry and pull the End Housing (#9) away from the Brake Assembly.

   **CAUTION** - Be careful not to damage the sealing lip of Oil Seal (#160) when removing the End Housing.

5. Remove and discard O-Ring (#30) from Piston Housing (#10) shoulder.

6. Remove the Brake Stack from the Hub (#2) spline and Piston Housing (#10) braking lugs.

   **NOTE** - When removing the Brake Stack always keep the Drive Plates and Friction Discs in the same order as they were removed.

7. Remove the (2) Sight Gauges (#46) from the End Housing (#9) for cleaning.

   The following Sections 7-3, 7-4 and 7-5 requires the motor brake to be removed from the drive motor.

**7-4 HUB (#2) REMOVAL AND DISASSEMBLY**

1. Pull the Hub (#2) straight up and out of the Brake Assembly. Be careful not to damage the sealing lip of Oil Seal (#31).

2. Remove Bearing (#20) with a bearing puller if it needs replaced.

3. Check the Wear Sleeves (#32) and (#86). If they are damaged, remove them with the following procedure. (See Figure 7.3)
   a. Place the Hub (#2) into appropriate V-Block Support.
   b. Make several notches in the Wear Sleeves with a chisel the same width as the Wear Sleeve.
   c. The Wear Sleeves can now be removed from the hub by hand.

---

**Figure 7.2 - Removing Brake from the Drive Motor**

**Figure 7.3 - Removing Wear Sleeves**
7-5 PISTON HOUSING DISASSEMBLY  
(See Figure 10.2)  
1. Remove the (8) Screws (#151) and (8) Lockwashers (#129) from Housing (#8).  
2. Pull the Piston Housing Assembly away from Housing (#8). Remove and discard O-Ring (#33).  
3. Remove the (8) Screws (#72) and (8) Lockwashers (#127) from the Piston Retainer (#11).  
   CAUTION - Be very careful when removing these screws because this Piston Housing Assembly is under spring pressure. Evenly back the screws out to relieve the spring pressure.  
4. Remove the (6) Springs (#36) from the spring pockets in the Piston (#3).  
5. Remove the O-Ring (#30) from the Piston Retainer (#11) shoulder and discard it.  
6. Push the Piston (#3) out of the Piston Housing (#10).  
7. Remove and discard the Liner (#42) and O-Ring (#39) in the Piston Housing (#10).  
8. Remove and discard the Liner (#43) and (2) O-Rings (#40) from the Piston (#3).  

7-6 REMOVING OIL SEALS  
1. Check Oil Seal (#160) in the End Housing (#9). If the sealing lip is damaged then press it out with an arbor press.  
2. Check Oil Seal (#31) in the Housing (#8). If the sealing lip is damaged then press it out with an arbor press.  

Section 8  
CLEANING AND INSPECTION  

8-1 CLEANING AND INSPECTION  
Clean metal parts in a suitable solvent and dry with low pressure compressed air. Clean drive plates (#13) and (#18) in a solvent but do not clean the Friction Discs (#12) in solvent. Use only a clean, dry and lint free rag to clean these friction discs. Keep drive plates and friction discs in the same order as they were when removed. After cleaning, inspect parts for cracks, distortion, scoring, nicks, burrs or any other damage that would affect the operation of the brake.  
Pay particular attention to the following:  
1. Check the friction discs for wear, surfaces for scoring, galling or evidence of uneven wear.  
2. Check the brake drive plates for scoring or galling. Make sure they are flat. If a perceptible ridge is worn in the drive plate where it mates with the friction disc, it should be replaced.  
3. Carefully check the piston and bore surfaces for nicks, scratches, scoring or other damage which would affect operation or cause leakage.  
4. Pay particular attention to the (2) Wear Sleeves (#32) and (#86) and the (2) Oil Seals (#31) and (#160). Check for any nicks, scratches or any damage that would cause leakage.  

8-2 REPAIR OR REPLACEMENT  
A fine stone or crocus cloth may be used to remove minor surface defects from parts, if the operation or sealing action of the part is not affected. The use of coarser abrasives or other machining methods should not be attempted. Otherwise, damaged parts should be replaced.  
Replacement is recommended for the following parts when needed.  
1. Replace all O-rings, Liners, Wear Sleeves and Oil Seals removed during disassembly.  
2. Replace Brake Discs and Drive Plates as a complete set.
Section 9
REASSEMBLY

9-1 GENERAL REASSEMBLY INSTRUCTIONS

See Figures 10.1 and 10.2 for a visual reference to all of the parts to be reassembled.

Note the following general reassembly instructions as applicable:

1. Lubricate O-Rings, Liners and Oil Seal lips with a light coating of White Grease or equivalent immediately before reassembly or installation of mating parts.

2. Use Red Loctite (#262) when installing new Wear Sleeves on the Hub.

3. The installation of bearings can be accomplished two ways. They can be heated up in an oven to 200°F and dropped on the shaft or they can be pressed on with an arbor press.

9-2 INSTALLING OIL SEALS
(See Figure 10.2)

1. First clean the oil seal bores in the Housing (#8) and the End Housing (#9). Make sure they are clean and free of any foreign material.

2. Coat the oil seal bores with a thin coat of (Permatex #3 Sealant). Press Oil Seal (#31) into Housing (#8) and Oil Seal (#160) into End Housing (#9) with an arbor press. Be sure to clean off any excess sealant.

9-3 HUB REASSEMBLY
(See Figure 10.2)

1. Heat up the Bearing (#20) in an oven to 200°F and drop it on the Hub (#2) or press it on to the Hub (#2) with an arbor press until it seats against the shoulder. (See Figure 9.1)

CAUTION - Be sure to wear gloves when handling heated parts

2. Apply Red Loctite #262 to the hub diameter and press the Wear Sleeve (#32) on to the Hub (#2) as shown in Figure 9.2.

A Special Assembly Tool is necessary to install the Wear Sleeve (#86) on to the Hub (#2). Dimensions and material specifications are given in Figure 9.3 if you prefer to make your own. It can also be ordered from the Besser Company with the Part Number 114805.
3. Apply Red Loctite #262 to the hub diameter and with Surface “A” of the Assembly Tool (#114805) press the Wear Sleeve (#86) flush with the hub shoulder as shown in Step 1 in Figure 9.4.

Turn the Assembly Tool (#114805) over and with Surface “B” finish seating the Wear Sleeve (#86) until it bottoms out. (See Step 2 in Figure 9.4)

4. Place the Piston Housing (#10) flat on the table with the brake lugs pointed down.

5. Apply a light coat of White Grease or equivalent to the Liner (#42) installed in the Piston Housing (#10) and the Liner (#43) on the Piston (#3).

6. Place the Piston (#3) into the Piston Housing (#10). Be very careful not to damage the (2) Teflon Liners (#42) and (#43).

7. Place the (6) Springs (#36) into the Piston (#3) spring pockets as shown in Figure 9.5.

8. Lubricate the O-Ring (#30) with White Grease or equivalent and place it on the Piston Retainer (#11).

9. Bolt the Piston Retainer (#11) to the Piston Housing (#10) with (8) Screws (#72) and (8) Lockwashers (#127). Torque to 37 Ft. Lbs.

NOTES:
1. Make sure the 1/4" NPT hole for shop air is located at the bottom to prevent condensation from accumulating in the piston chamber.

2. Fasten these (8) Screws down in an even manner to correctly compress the Springs (#36).

10. Lubricate the O-Ring (#33) with White Grease or equivalent and place it on the Piston Retainer (#11) shoulder.

11. Set the Housing (#8) on the Piston Retainer (#11) and attach with (8) Screws (#151) and (8) Lockwashers (#129). Torque to 37 Ft. Lbs.

9-5 INSTALLING HUB (#2)
(See Figure 10.2)
1. Turn the Brake Assembly over with the Piston Housing brake lugs pointed up.

2. Apply a light coat of White Grease or equivalent to the Wear Sleeve (#32). This will facilitate sliding the Hub into the Oil Seal (#31).

IMPORTANT: Use special care not to damage the oil seal lip when inserting the hub into the brake assembly.

3. Insert the Hub (#2) down and into the Oil Seal (#31). Make sure the Hub (#2) stays in a vertical position.

9-6 INSTALLING SEPARATOR SPRINGS
(See Figure 10.2)
Vibrator Drive Motor Brakes require the use of separator springs. They are used to prevent residual drag and to improve cooling.
1. Install (4) Separator Springs (#17) on each Drive Plate (#18). (See Figure 9.6) The springs just snap over the large end of the rivets.

   **NOTE:** Do not install Separator Springs (#17) on the Drive Plate (#12).

**Figure 9.6 - Separator Springs**

---

**9-7 INSTALLING BRAKE STACK**

(See Figure 10.2)

1. Apply 60 to 80 PSI to the 1/4’ NPT brake port at the bottom of the Piston Housing (#10) so the Piston (#3) will retract fully.

2. While the air pressure is being applied, install the Brake Stack as shown in Figure 9.7.

   Install a Drive Plate (#18) with the Separator Springs (#17) pointing up. Then a Friction Disc (#12). Install a total of (5) Drive Plates (#18) and (5) Friction Discs (#12). Then install a Drive Plate (#12) which has no Separator Springs on it.

   **NOTE:** Align the teeth in the Friction Discs (#12) with the spline teeth on the Hub (#2) and the notches in the Drive Plates (#18) and (#12) with the lugs on the Piston Housing (#10).

**Figure 9.7 - Brake Stack Arrangement**

---

**9-8 INSTALLING END HOUSING (#9) TO BRAKE ASSEMBLY**

(See Figure 10.1 and 10.2)

1. Lubricate O-Ring (#30) with a light coat of White Grease or equivalent and place it on the Piston Housing (#10).

2. Slide the End Housing (#9) down over the Hub (#2) until the Bearing (#20) seats in the bearing bore.

   **CAUTION:** Be very careful not to damage the sealing lip of Oil Seal (#160) installed in the End Housing.

   **NOTE:** Make sure the breather hole is located at the top.

3. Attach the End Housing with (6) Screws (#72) and (6) Lockwashers (#127). **Torque to 25 Ft. Lbs.**

   **NOTE:** Leave the (2) mounting holes empty where the Mounting Bracket (#271) attaches to. (See Figure 9.8)

   **Figure 9.8 - Attaching End Housing (#9)**

4. Install the Sight Gauge (#46) on the L.H. side of the End Housing (#9).

5. Attach the Mounting Bracket (#271) with (2) Screws (#273) and (2) Lockwashers (#275). **Torque to 25 Ft. Lbs.**

6. If the Control Valve (#270) was removed then attach it to the bracket with (2) Screws (#272) and (2) Lockwashers (#274).

   **It is safe now to release the piston air pressure.**
9-9 INSTALLING COOLING FAN (#25)
(See Figures 9.9 and 10.2)

1. Make sure the ID of the Clamping Ring (#331) and the mating surface of the Hub (#2) is thoroughly clean of any oil or grease.

2. Apply Loctite Primer T and Blue Loctite #242 to the OD of the Hub (#2) and the threads of the Screw in the Clamping Ring (#331).

3. Position the Clamping Ring (#331) on the Hub (#2) so it is flush with the Hub (#2) shoulder as shown in Figure 9.9.

---

9-10 INSTALLING THE BRAKE ASSEMBLY TO THE DRIVE MOTOR

Attach the Brake Assembly to the Drive Motor as per instructions given in Section 3 - INSTALLATION.

9-11 FINAL REASSEMBLY PROCEDURE
(See Figures 10.1 and 10.2)

1. Re-attach Fan Shroud (#24) with (4) Screws (#166) and (4) Lockwashers (#167).

2. Replace the other Sight Gauge (#46) on the R.H. side and Drain Plug (#74) back into the End Housing (#9).

   Also replace the Pipe Nipple (#77) and Pipe Cap (#67) back into the Housing (#8) if they were removed.

3. Fill the unit with fresh fluid as directed in Section 4 - LUBRICATION.

4. Connect any hoses or fittings from the Control Valve as shown on Figure 10.1.

   Reconnect electrical connections to the valve solenoid.

   Hookup 60 to 80 PSI shop air to the control valve.

5. Make an Operational Check as specified in Section 5.

6. Reinstall Reducer Bushing (#76) and Air Breather (#45) into the top of the End Housing (#9).

Reassembly and Installation is now complete and your BESCOSTOP Motor Brake is ready for service.
Section 10
ORDERING REPAIR PARTS

10-1 GENERAL INFORMATION
This section lists, describes and illustrates all available repair parts for the BESCOSTOP Motor Brake.
The models covered in this manual is the MB-280-223 and MB-280-238.
Parts are identified on the exploded view drawings (Figure 10.1 and 10.2) with Reference Numbers. These numbers are the same as used in the parts listing.

10-2 ORDERING MAJOR and MINOR REPAIR PARTS KITS
Contact the Besser Central Order Department when ordering any repair parts, please specify all of the following information:
1. COMPLETE MODEL NUMBER (On Name plate).
2. SERIAL NUMBER (On Name plate).
3. PART REFERENCE NUMBER (From Parts List and Exploded View Drawing).
4. PART NAME (From Parts List).
5. QUANTITY (As Required).
6. COMPLETE SHIPPING INFORMATION

10-3 NAME PLATE INFORMATION
(This Name Plate is located on the Piston Housing.)

IMPORTANT
Failure to include all of the specified information will only delay your parts order. Unless another method is specified for Shipping Information, parts weighing less than 150 lbs. will be shipped United Parcel Service. Parts weighing over 150 lbs. will be shipped motor freight. Air freight and other transportation services are available but only if specified on your order.

10-4 FACTORY REBUILD SERVICE
Reconditioning Service is offered by Force Control exclusively through the Besser Company. Before returning any unit to Force Control, contact the Besser Company Central Order Department for shipping instructions and order processing. The Besser Company will arrange proper authorization from Force Control for return of the unit(s) for repair. Neither Force Control or the Besser Company can be responsible for any units returned without first following the procedures outlined.

Care must be given to the packaging of returned units. Always protect mounting feet and flanges by attaching to a suitable skid. Shipment-damaged units always delay repairs. It usually impossible to recover damage costs from the carrier. Whenever possible describe the problems you are having with your motor brake on your shipping papers.

Return To: Force Control Industries, Inc.
Contact the Besser Central Order Department for a complete return address.
