

# Hazardous Duty Brakes and Clutches Featuring Oil Shear Technology

**Designed for Dusty, Dirty, Wet, Abrasive  
Environments, and Explosive Atmospheres.**

## Air Actuated Clutches & Brakes

Used with hazardous duty valves and air motors for hazardous locations.

Internal temperature sensors and the totally enclosed marine duty housing add to the benefits.

Oil Shear Technology assures long life, no adjustment, and minimal maintenance.

## Hydraulically Actuated Clutches & Brakes

Used with explosion proof valves and motors for hazardous locations when air is not available.

Internal temperature sensors and the totally enclosed marine duty housing add to the benefits.

Oil Shear Technology assures long life, no adjustment, and minimal maintenance.

## Electric Released Spring Set Motor Brakes

The MagnaShear hazardous duty motor brakes are rated for Class I and II Div 2, Groups A, B, C, D, E, F, and G. They are used in hazardous locations such as coal, grain, sugar, wood, chemicals, and petroleum products.

No adjustment-ever and maintenance free 5 to 10 year service life, offers the best return on investment.

# Hazardous Duty Clutches & Brakes Featuring Oil Shear Technology

Force Control Industries, Inc. manufactures hazardous Duty Clutches and Brakes for many conditions including wet, dusty, or explosive environments, and low temperature (-40C) applications.

**Clutches:** Force Control manufactures clutches that are actuated either by pneumatic pressure or hydraulic pressure. For air actuated units air pressure from outside is regulated and controlled via solenoid valve to actuate the clutch and or brake. In some cases the clutch and brake are in the same unit known as a clutch brake. The totally enclosed sealed housing, make the Force Control Posidyne Clutch brake and Posistop brakes ready for many hazardous applications including dusty, dirty, and wet environments. Special modifications are made for severe wash down, or marine duty which include stainless steel fittings, nickel plated shafts, and special Steel It coating.

For explosion proof applications the units can be operated with air motors, or explosion proof electric motors. With explosion proof solenoid valves the units can be used in many explosive environments including Class I, II, and III.

**Brakes:** Force Control manufactures brakes that can be actuated via air, hydraulic, or electric. The air and hydraulic actuated units can be pressure set spring release, or spring set and pressure release. With explosion proof valves the air and hydraulic actuated units are good for Class I, II, III. Electric release spring set motor brakes are rated for Class I and II Div 2, Groups A, B, C, D, and F.

**Sizes:** Clutches and brakes are available in sizes from 1 horsepower to 2000 horsepower and torque rating up to 200,000 Lb. Ft. (271,000 NM).

**Industries:** Force Control Industries clutches and brakes are used in many industries including coal mining, transporting, loading docks, ports, grain handling, marine, and oil and gas drilling.

**Applications:** include winches, cranes, mooring and anchor winches, drawworks auxiliary brakes, car spotters, barge positioning, and many more.

**Oil Shear Technology:** The heart of Force Control products is oil shear technology. Flowing transmission fluid through the center hub out through the friction stack both transmits torque without physical wear on the friction discs, and removes the heat of engagement to the housing for dissipation. This nearly eliminates friction disc wear, requires no adjustment, and last with minimal service (check fluid level and change annually) for many years.
